SUPPLY CHAIN MANAGEMENT LOGISTICS

The Simhasth will operate as a temporary city with substantial demand for food, drinking water, medical supplies, sanitation materials, fuel, consumables, religious-use products and other essential commodities. At the same time, unrestricted movement of supply vehicles into high-density areas can create significant traffic and safety challenges.

The logistical challenge is therefore to ensure that essential supplies reach the right location, at the right time and in the required quantity, while minimising congestion, wastage, stock-outs and unnecessary vehicle movement.

The system must account for fluctuating demand, geographically distributed service points, temporary storage facilities, restricted movement zones and changing access conditions.

Some of the challenges include:

- Forecasting demand for essential commodities across temporary facilities and service zones
- Maintaining adequate inventory at different locations and preventing stock-outs
- Managing multiple suppliers and service providers
- Movement of goods and supplies during peak pilgrim movement
- Managing medical and emergency supplies
- Coordinating logistics during emergencies and sudden demand surges

Participants are expected to exhibit capabilities in technology and/or logistics and supply-chain planning. Proposals should address the aforementioned challenges and potential areas of applications can include, but are not limited to:

- Using technology for dynamic inventory management, demand forecasting, optimizing routing, planning of distributed locations of temporary facilities for warehousing, supplier management, etc.
- Medical and emergency inventory management, effective coordination with healthcare centres and pharmacies.
- Reverse logistics and reusable packaging systems
- Integration with traffic and crowd management systems.
- Managing distributed warehousing networks.

This is the general direction in which applicants are encouraged to think. However, applicants are welcome to submit proposals rooted in principles that do not feature in this list but are capable of address challenges of supply chain and logistics anticipated during the Simhasth.
